science - from black holes to DNA, from the big bang to the workings of the brain John Gribbin is one of the few science writers who is equally comfortable writing about biology as about physics, and this beginner's guide will take the reader through the basics and the fundamental issues of the crucial areas of modern science, from the birth of the universe through to the evolution of our own species, the nature of human behaviour and the workings of our minds. Crucially, the book will not only provide an overview of the central areas in a single volume, but also explain how the areas link up, what evolutionary theory has to say about how we think, how sub-atomic particles came into being in the big bang, and atoms in stars.

The focus of this Handbook is on science education in Arab states and the scholarship that most closely supports this program. The reviews of the research situate what has been accomplished within a given field in an Arab rather than an international context.

The "science wars" have been raging for decades, raising many questions about the power of science. Some critics claim that science, including social science, is "merely a social construction" that fallible humans have created with words and other symbols. If this is true, is science as formidable a source of knowledge as most scientists claim? Baldwin explains why the edifice of science has

robust properties that make it one of the most useful forms of knowledge that humans have ever created, although it is not perfect. He trenchantly examines all sides of the debate and uses the philosophy of pragmatism to reveal the special characteristics that make science work as well as it does. Ending the Science Wars shows how science is far better grounded than its critics claim. The book not only helps resolve many current debates about science, it is a major contribution for explaining science in terms of a powerful philosophical system. This makes the book valuable to scientists in all fields of research-and intellectually challenging for science's critics.

From Plato until now, thinkers throughout history inquired the nature of truth and its attainment. In a world where many allege to

possess the "ultimate" truth, the book examines if a claim to truth is ever certain. Why question beliefs? What counts as evidence? What are credible beliefs? Is science true? Can the future be predicted with certainty? These are some of the questions Joseph Erban investigates in his latest book that explores What is Truth?

Originally published in 1986, this book is a result of the first International Conference on Personal Relationships held in 1982. The conference itself was a significant event in publicly bringing together major figures whose work was starting to define the new area of personal relationships. The chapters are arranged to follow the structure of the conference program, with major opening and

closing discussions covering the whole field and the rest of the chapters grouped under the headings of Depiction and Taxonomy of Relationships; Development and Growth of Relationships and Disorder and Repair of Relationships. The result is by no means a comprehensive treatment of the field, but the editors hoped that the book highlighted significant issues in personal relationship research as well as some excellent examples of the ways in which issues and problems were being tackled at the time. They also hoped that it would have an effect on the future development of the field of personal relationships by indicating its value and potential.

Britain. Reconciling Science and Religion provides a comprehensive survey of the interplay between British science and religion from the late nineteenth century to World War II. Peter J. Bowler argues that unlike the United States, where a strong fundamentalist opposition to evolutionism developed in the 1920s (most famously expressed in the Scopes "monkey trial" of 1925), in Britain there was a concerted effort to reconcile science and religion. Intellectually conservative scientists championed the reconciliation and were supported by liberal theologians in the Free Churches and the Church of England, especially the Anglican "Modernists." Popular writers such as Julian Huxley and George Bernard Shaw sought to create a non-Christian religion similar in some respects to the Modernist position. Younger scientists and secularists—including Rationalists such as H. G. Wells and the

Marxists—tended to oppose these efforts, as did conservative Christians, who saw the liberal position as a betrayal of the true spirit of their religion. With the increased social tensions of the 1930s, as the churches moved toward a neo-orthodoxy unfriendly to natural theology and biologists adopted the "Modern Synthesis" of genetics and evolutionary theory, the proposed reconciliation fell apart. Because the tensions between science and religion—and efforts at reconciling the two—are still very much with us today, Bowler's book will be important for everyone interested in these issues.
