The Discovering the Past series is an integrated series of colour textbooks that offers enquiry-based tasks. Contrasts and Connections is a Schools' History Project core textbook, designed for Year 7. Included are units on the Roman Empire, Medieval Realms and Islamic civilizations.

This is the Schools History Project's core text for National Curriculum history in Year 7. This book covers two core study units - the Roman Empire and medieval realms (along with a supplementary unit on Islamic civilizations). It builds on links between the three units to provide a culturally balanced and coherent scheme of work for the first year of Key Stage 3.

'CLIL Activities' is organised into five chapters: activating, guiding understanding, focus on language, focus on speaking, and focus on writing. A further chapter provides practical ideas for assessment, review and feedback.

In the course of his career, Professor Richard M. Frank of the Catholic University of America produced a hugely significant corpus of works on the intellectual activity in Classical Islam known as Kalam, which he argued should be rendered as 'speculative theology'. He also wrote on the Qur'an, on the Arabic and Syriac philosophical tradition, and argued vigorously for a new reading of the famous religious scholar and theologian al-Ghazali (d. 1111) as a devotee of the cosmology of Ibn Sina (d. 1037). In this volume, fourteen scholars, many of them contemporaries of Professor Frank, engage with his legacy with important and seminal works which take some of his ideas as their points of departure. The book is divided into six sections: the Qur'an, Paths to al-Ash'ari, Al-Ash'ari and the Kalam, Christian Falsafa, Avicenna and Beyond, and Al-Ghazali on Causality. There are major articles on Qur'anic emendations and Arabia and Late Antiquity, on the Arabic Plotinian Tradition, on Syriac Philosophical Vocabulary, and an important reading of the Greek-Arabic translation movement in terms of the practical and exact sciences. There are seminal studies of atomism, with valuable translations of complex theological passages previously untranslated, of the Christian philosophy of Yahya Ibn 'Adi, of a late Mu'tazili argument for the existence of God and a hitherto unedited section on optics by Ibn Mattawayh. These are complemented by important, close readings of Avicenna's epistemology and his Metaphysics together with a major, new survey of the Avicennan tradition in the madrasas of the Islamic East. The volume ends with two discussions of the perennial question of al-Ghazali's theory of causality. In addition, the volume contains an autobiographical piece by Professor Frank and a complete bibliography of his published works.

Effective science teaching requires creativity, imagination, and innovation. In light of concerns about American science literacy, scientists and educators have struggled to teach this discipline more effectively. Science Teaching Reconsidered provides undergraduate science educators with a path to understanding students, accommodating their individual differences, and helping them grasp the methods—and the wonder—of science. What impact does teaching style have? How do I plan a course curriculum? How do I make lectures, classes, and laboratories more effective? How can I tell what students are thinking? Why don't they understand? This handbook provides productive approaches to these and other questions. Written by scientists who are also educators, the handbook offers suggestions for having a greater impact in the classroom and provides resources for further research.

A pioneer in the field outlines new empirical and computational approaches to mapping the neural connections of the human brain. Crucial to understanding how the brain works is connectivity, and the centerpiece of brain connectivity is the connectome, a comprehensive description of how neurons and brain regions are connected. In this book, Olaf Sporns surveys current efforts to chart these connections—to map the human connectome. He argues that the nascent field of connectomics has already begun to influence the way many neuroscientists collect, analyze, and think about their data. Moreover, the idea of mapping the connections of the human brain in their entirety has captured the imaginations of researchers across several disciplines including human cognition, brain and mental disorders, and complex systems and networks. Discovering the Human Connectome offers the first comprehensive overview of current empirical and computational approaches in this rapidly developing field.

First published in 1938, 'Anthem' is a dystopian fiction novel by British writer Ayn Rand. It takes place at some unspecified future date when mankind has entered another dark age. Technological advancement is now carefully planned and the concept of individuality has been eliminated.
