The phrase "Daughter of Zion" is in recent Bible translations often rendered "Daughter Zion". The discussion behind this change has continued for decades, but lacks proper linguistic footing. Parlance in grammars, dictionaries, commentaries and textbooks is often confusing. The present book seeks to remedy this defect by treating all relevant expressions from a linguistic point of view. To do this, it also discusses the understanding of Hebrew construct phrases, and finds that while there is a morphological category of genitive in Akkadian, Ugaritic and Arabic, Hebrew, Aramaic and Syriac do not display it. The use of this term as a syntactical category is unfortunate, and the term should be avoided in Hebrew grammar. Metaphor theory and the use of irony are also tools in the discussion of the phrases. As a result of the treatment, the author finds that there are some Hebrew construct phrases where *nomen regens* describes the following *nomen rectum*, and the description may be metaphorical, in some cases also ironical. This seems to be the case with "Daughter of Zion" and similar phrases. This understanding calls for a revision of the translation of the phrases, and new translations are suggested.

There are many competitive works on the market concerning evolutionary biology, but this volume is quite distinctive in its idiographic aspect focusing on Ostracoda viewed from a wide range of disciplines, ages and environments. The book deals with various lines of idiographic biology and palaeontology of Ostracoda and nomothetic trials focusing strongly on evolutionary biology. Particular themes are morphology, biology, evolution, speciation, ecology, palaeoecology, deep sea fauna, biogeography, palaeobiogeography, biostratigraphy and exploration, all concerning Ostracoda. The last decade has witnessed a spectacular renewal of interest in the study of Ostracoda, particularly in the evolutionary biology of Ostracoda, including speciation. Ostracoda are unique, ranging in age from the Cambrian period to modern times with carapaces ready to be preserved as fossils, providing various lines of invaluable evidence regarding evolutionary processes. More than 120 participants from 20 countries assembled at the Ninth International Symposium on Ostracoda and this book is a collection of all the papers presented at the Symposium, plus selected papers submitted by non-attending members. It presents an outstanding record of much pioneering research and will be of interest to specialists in Ostracoda as well as all earth and life scientists concerned with evolution. Its value is further enhanced by easy-to-use indexes of authors, localities and taxa.

This important book draws together, for the first time, a vastwealth of information on all major aspects of the farming of Arcticcharr, a highly prized and

commercially valuable salmonid. The author, Gavin Johnston who has many years' experience of farming Arctic charr, teaching about and researching the species, has produced a book that is a landmark publication and an essential purchase for all those involved with the species. The book is broadly divided into three sections. The first section covers Arctic charr interactions with humans and the charr's biological requirements for culture. Section two is a practical guide to the art and science of early-rearing Arctic charr; a hands on application of current knowledge in Arctic charr aquaculture. The final section of the book focuses on the commercial production of Arctic charr, providing cutting-edge information for all those involved in the exploitation of this valuable species. Arctic Charr Aquaculture is an essential purchase for anyone involved in, or considering involvement in farming of this species. Farm managers and other personnel in fish farms and experimental aquaculture units, fish and aquatic biologists will find a huge amount of useful data in this book. Libraries in all university departments and research establishments where aquaculture, fisheries and fish biology are studied and taught should have copies of this book on their shelves. This book brings together for the first time the knowledge needed to farm and market Arctic Charr. Part One is an overview of Arctic Charr aquaculture beginning with the history and development of Charr aquaculture, the biological attributes of Arctic Charr, the physical requirements for growth and commercial production requirements. Other chapters are devoted to Charr health, nutrition and feeding. Part Two is a practical guide for the producer operating an Arctic Charr farm either as a vertically integrated operation or as discrete hatcheries and grow out farms. Part Three is devoted to the business of commercially producing Arctic Charr, and although it deals specifically with Charr it also covers many business aspects of farming relevant to any fish species under cold water cultivation. It covers farm business management, the economics and finance of Arctic Charr farming, marketing Charr products and a closing section on how to avoid the pitfalls which others including the author have experienced.

Birds of Prey of the West and its companion volume, Birds of Prey of the East, are the most comprehensive and authoritative field guides to North American birds of prey ever published. Written and lavishly illustrated with stunning, lifelike paintings by leading field-guide illustrator, photographer, and author Brian Wheeler, the guides depict an enormous range of variations of age, sex, color, and plumage, and feature a significant amount of plumage data that has never been published before. The painted figures illustrate plumage and species comparisons in a classic field-guide layout. Each species is shown in the same posture and from the same viewpoint, which further assists comparisons. Facing-page text includes quick-reference identification points and brief natural history accounts that incorporate the latest information. The range maps are exceptionally accurate and much larger than those in other guides. They plot the most up-to-date distribution information for each species and include the location of cities for more accurate reference. Finally, the guides feature color habitat photographs next to the maps. The result sets a new standard for guides to North America's birds of prey. Lavishly illustrated with stunning, lifelike paintings. Written and illustrated by a leading authority on North American birds of prey. Depicts more plumages than any other guide. Concise facing-page text includes quick-reference identification points. Classic field-guide layout makes comparing species easy. Large, accurate range maps include up-to-date distribution information. Unique color habitat photographs next to the maps.

Avoiding Attack discusses the diversity of mechanisms by which prey avoid predator attacks and explores how such defensive mechanisms have evolved through natural selection. It considers how potential prey avoid detection, how they make themselves unprofitable to attack, how they communicate this status, and how other species have exploited these signals. Using carefully selected examples of camouflage, mimicry, and warning signals drawn from a wide range of species and ecosystems, the authors summarise the latest research into these fascinating adaptations, developing mathematical models where appropriate and making recommendations for future study. This second edition has been extensively rewritten, particularly in the application of modern genetic research techniques which have transformed our recent understanding of adaptations in evolutionary genomics and phylogenetics. The book also employs a more integrated and systematic approach, ensuring that each chapter has a broader focus on the evolutionary and ecological consequences of anti-predator adaptation. The field has grown and developed considerably over the last decade with an explosion of new research literature, making this new edition timely.

There are an estimated 40,000 species of chrysomelids, or leaf beetles, worldwide. These biologically interesting and often colorful organisms, such as the tortoise beetles, have a broad range of life histories and fascinating adaptations. For example, there are chrysomelids with shortened wings (brachypterous) and elytra (brachelytrous), other species are viviparous, and yet other leaf beetles have complicated anti predator-parasitoid defenses.

In Vitamania, award-winning journalist Catherine Price takes readers on a lively journey through the past, present and future of the mysterious micronutrients known as human vitamins -- an adventure that includes poison squads and political maneuvering, irradiated sheep grease and smuggled rats. Part history, part science, part personal exploration, Price's witty and engaging book reveals how vitamins have profoundly shaped our attitudes toward eating, and investigates the emerging science of how what we eat might affect our offspring for generations to come.--AMAZON.

English Words aims to arouse curiosity about English words and about the nature of language in general, especially among introductory students who do not intend to specialize in linguistics.

Originally published in 1974, this updated and substantially revised edition includes chapters on inflectional and lexical morphology, derivational processes and productivity, compounds, paradigms, and much new material on markedness and other aspects of iconicity.
