A compressor is a machine for raising a gas – a compressible fluid – to a higher level of pressure., actually making the air denser by cramming air into a small space.

Pump: A pump is a machine for raising a liquid – a relatively incompressible fluid – to a higher level of pressure or head.

Blower – Mechanical Engineering

1. Water Pump: Water enters at low level and pumped to a higher level, pump being driven by an electric motor. The mass (water) and energy (electricity) cross the boundary of the system (pump and motor).

2.Scooter engine: Air and petrol enter and burnt gases leave the engine.

Fluid mechanics is basically $F = d(mv/dt)$ (Newton ' s 2nd Law, the sum of the forces is equal to the rate of change of momentum) applied to a fluid. What distinguishes a fluid from a solid is that a solid deforms only a finite amount due to an applied shear stress (unless it breaks),
