Many problems and theorems in graph theory have to do with various ways of coloring graphs. Typically, one is interested in coloring a graph so that no two adjacent vertices have the same color, or with other similar restrictions. One may also consider coloring edges (possibly so that no two coincident edges are the same color), or other variations.

Graph Theory Problems And Solutions | calendar.pridesource

Graph theory has abundant examples of NP-complete problems. Intuitively, a problem is in P1 if there is an efficient (practical) algorithm to find a solution to it. On the other hand, a problem is in NP 2, if it is first efficient to guess a solution and then efficient to check that this solution is correct. It is conjectured (and not known) that $P \neq NP$.
