1. Definition of the Antenna and Wave-Motion The radio antenna may be defined as the interface between a circuit in which electrical power is constrained to follow conducting paths, and electromagnetic radiation travelling freely through space. The antenna may convert power in the circuit into radiated energy or vice versa, forming either

1. In 1887, Henrich Hertz demonstrated that electromagnetic energy could be sent out into space in the form of radio waves. Radio waves travel at the speed of light in free space, 186,000 miles per second, or 300,000,000 meters per second. Free space implies that radio waves travel through empty space or a vacuum.

RADIO WAVE PROPAGATION AND ANTENNAS

Types of radio propagation. There are a number of categories into which different types of RF propagation can be placed. These relate to the effects of the media through which the signals propagate. Free space propagation: Here the radio waves travel in free space, or away from other objects which influence the way in which they travel. It is only the distance from the source which affects the way in which the signal strength reduces.
