A rectifier is an electrical device that converts alternating current (AC), which periodically reverses direction, to direct current (DC), which flows in only one direction. The reverse operation is performed by the inverter. The process is known as rectification, since it

Rectifier - Wikipedia

A Rectifier converts AC into DC. There are two types of rectifiers, half wave, and the full wave. The first, the topic of our interests, only allows one portion of the input AC and blocks the other. In this post, a design procedure is

you would be able to
design a half wave

The rectifier circuit,
which is typically made
from a set of cleverly
interlocked diodes,
converts alternating
current to direct current.

A modern motorcycle rectifying regulator is a complex device constructed of a series of semiconductors mounted on a printed circuit board and packed in a compact housing. It controls every aspect of charging and power supply systems, so it
