Emergency and critical care medicine is one of the fastest growing fields of veterinary practice. Virtually every life-threatening disease can present for emergency evaluation, requiring knowledge of internal medicine, neurology, cardiology, oncology, anesthesia, and much more. Rapid and effective application of this knowledge can mean the difference between life and death for the animal. Critical care requires the recognition of subtle changes in the clinical course of animals, and the ability to take corrective action before severe systemic disease becomes irreversible. Clinical decisions regarding seemingly small items, such as fluid therapy, antibiotics, or analgesics, can have a profound impact on patient outcome. This book focuses on management of the more common emergency and critical care conditions encountered in clinical practice, collated in a concise manual. There are chapters on emergencies affecting each body system, on toxicology and other environmental causes, and on critical care techniques ranging from patient monitoring, anesthesia and analgesia to fluid therapy, transfusion medicine and nutritional support, plus a chapter describing clinical skills and procedures. The text is illustrated by top-quality color photos, imaging and diagrams, and key information is highlighted in tabular form. The authors combine experience in teaching and in clinical practice, and provide a ready resource for all those actively engaged in the field: practitioners and trainees, technicians, and nurses.

-- The standards of both the Intravenous Nursing Society and the Centers for Disease Control are emphasized throughout the manual; in addition, competency criteria will serve as a reference for hospital policy and procedure development required by the Joint Commission on Accreditation of Healthcare Organizations (JCAHO) -- The text keeps students up to date by thoroughly detailing step-by-step procedures for such new practices as subcutaneous infusion of pain medication, peripherally inserted central catheters (PICCs), epidural pain medication administration, and patient-controlled analgesic therapy -- Contains pretest and post-test questions, chapter outlines, chapter objectives, chapter summaries, and chapter glossaries to help the user identify strengths as well as weaknesses; also includes worksheets in appropriate chapters to enhance learning -- Two new chapters added: Infection Control and Antineoplastic Therapy -- Competency criteria added to appropriate chapters -- Nursing Process Model added -- Patient teaching guidelines provided -- Newest INS standards included -- Easy-to-use chart comparing various IV solutions

**Medical Biochemistry** was first published in 1986. A good knowledge of biochemical analysis is essential for today's health-care practitioners, who, with their patients, face a widening array of laboratory tests to aid in diagnosis. The requisite biochemical methods and principles are best understood if medical students perform their own experiments, yet most currently available laboratory manuals are intended for general biochemistry courses and lack the clinical orientation that could make them useful in a medical context. John Van Pilsum and Robert Roon have designed this Laboratory manual specifically to introduce first-year medical students to clinical methods in biochemistry and to help them understand basic biochemical principles as they are applied to medical practice. Each chapter in **Medical Biochemistry** is devoted to a basic set of related problems and includes, along with laboratory procedures, a clear and readable introduction, a list of selected references, and questions. All of the experiments call for procedures that are used routinely in most clinical laboratories. The areas covered include: electrophoresis of blood proteins, enzymes as diagnostic indicators, lactate dehydrogenase isozymes, the determination of glucose, blood lipids, experiments with nucleic acids, inheritable diseases and genetic engineering, the use of radioisotopes in clinical biochemistry, glycosylated hemoglobin, steroid hormone formation, immunoelectrophoresis of serum proteins, radioimmunoassay of thyroxine, serum electrolytes and carbon dioxide, and the lecithin-sphingomyelin ratio of amniotic fluid. The contributors, besides Van Pilsum and Roon, include: Marilyn H. Koenst, John D. Lipscomb, James B. Howard, Esther F. Freier, Ivan D. Frantz, Denise M. McGuire, Howard C. Towle, Dennis M. Livingston, Ronald D. Edstrom, Robert P. Changler, Frank Ungar, Maureen A. Scaglia, James F. Koerner, and Charles W. Carr.
