Unraveling the DNA Myth: The Spurious Foundation of Genetic Engineering. Barry Commoner argues that the central "dogma" of genetic engineering, that DNA alone controls protein synthesis in a one-to-one correspondence between genes and proteins, is highly questionable. If the relationship between DNA and its cellular consequences is not as simple as genetic engineers claim (due to "alternative splicing"), then the result of modifying the genome of plants, animals, or humans is not predictable.

The unique structure of chromosomes keeps DNA tightly wrapped around spool-like proteins, called histones. Without such packaging, DNA molecules would be too long to fit inside cells. For example, if all of the DNA molecules in a single human cell were unwound from their histones and placed end-to-end, they would stretch 6 feet.
