Map the innovation space—and blaze a path to profits and growth Countless books, articles, and other advice promise leaders solutions to the complex challenges they face. Some offer quick, silver-bullet remedies—a straight line to success!—and some are so technical that readers get lost before they begin. Now, there ' s Mapping Innovation, a refreshing alternative in the crowded business innovation space. Engaging and informative without sacrificing substance and expertise, this groundbreaking guide provides thorough background on some of the greatest innovations of the past century as well as . It details the processes that advanced them from inception to world-changing products—and shows you how to replicate their success. Business innovation expert Greg Satell helps you find your way by revealing the four models of innovation: Basic Research, Breakthrough Innovation, Sustaining Innovation, and Disruptive Innovation. One size does not fit all, so he provides a framework—the Innovation Matrix—for discovering which “ type ” of innovation process best suits the problem you need to solve. It ' s about asking the right questions, so that you can apply the right strategies to the problems you need to solve. In the end, you ' ll have a crystal clear model for disrupting the marketplace, scaling your efforts to propel your enterprise forward, and leverage digital platforms to your advantage. Mapping Innovation offers a simple and accessible but powerful approach to developing a strategy that will put you light years ahead of the competition!.

Design and optimization of integrated circuits are essential to the creation of new semiconductor chips, and physical optimizations are becoming more prominent as a result of semiconductor scaling. Modern chip design has become so complex that it is largely performed by specialized software, which is frequently updated to address advances in semiconductor technologies and increased problem complexities. A user of such software needs a high-level understanding of the underlying mathematical models and algorithms. On the other hand, a developer of such software must have a keen understanding of computer science aspects, including algorithmic performance bottlenecks and how various algorithms operate and interact. "VLSI Physical Design: From Graph Partitioning to Timing Closure" introduces and compares algorithms that are used during the physical design phase of integrated-circuit design, wherein a geometric chip layout is produced starting from an abstract circuit design. The emphasis is on essential and fundamental techniques, ranging from hypergraph partitioning and circuit placement to timing closure.

The ever-increasing demands placed on combustion engines are just as great when it comes to this centerpiece-the piston.

Achieving less weight or friction, or even greater wear resistance, requires in-depth knowledge of the processes taking place inside the engine, suitable materials, and appropriate design and manufacturing processes for pistons, including the necessary testing measures. It is no longer possible for professionals in automotive engineering to manage without specific expertise of this kind, whether they work in the field of design, development, testing, or maintenance. This technical book answers these questions in detail and in a very clear and comprehensible way. In this second, revised edition, every chapter has been revised and expanded. The chapter on "Engine testing", for example, now include extensive results in the area of friction power loss measurement and lube oil consumption measurement. Contents Piston function, requirements, and types Design guidelines Simulation of the operational strength using FEA Materials Cooling Component testing Engine testing The target groups Engineers in the field of engine development and maintenance Lecturers and students in the areas of mechanical engineering, engine technology, and vehicle construction Anyone interested in technology Publisher MAHLE is a leading international development partner for the automotive industry. With its products for combustion engines and their peripherals as well as for electric vehicles, the group addresses all the crucial issues connected to the powertrain and air conditioning technology: from engine systems and components to filtration to thermal management.
