Wind turbine control systems. Principles, modelling and ...

Modern wind turbines generally operate at variable speed in order to maximise the conversion efficiency below rated power and to reduce loading on the drive-train. In addition, pitch control of the blades is usually employed to limit the energy captured during operation above rated wind speed. The higher complexity of variable-speed variable-pitch turbines is offset by the benefits of control flexibility, namely, higher conversion efficiency, better power quality, longer useful life, because ...

Wind Turbine Control Systems | SpringerLink

Wind turbine control systems are typically divided into three functional elements: 1. the control of groups of wind turbines in a wind farm, 2. the supervising control of each individual wind turbine, and 3 separate dedicated dynamic controllers for dierent wind tur- bine sub-systems.

1 Wind Turbine Control - University of Notre Dame

Wind turbine control is necessary to ensure low maintenance costs and efficient performance. The control system also guarantees safe operation, optimizes power output, and ensures long structural life. Turbine rotational speed and the generator speed are two key areas that you must control for power limitation and optimization.

When the wind strikes the rotor blades, blades start rotating. The turbine rotor is connected to a high-speed gearbox. Gearbox transforms the rotor rotation from low speed to high speed. The high-speed shaft from the gearbox is coupled with the rotor of the generator and hence the electrical generator runs at a higher speed.
